

## 1. PROBLEM

- Decentralized networks and blockchains are massively popular
- Testing these systems is complex
- Testing should be done using only network traffic

## 2. SOLUTION

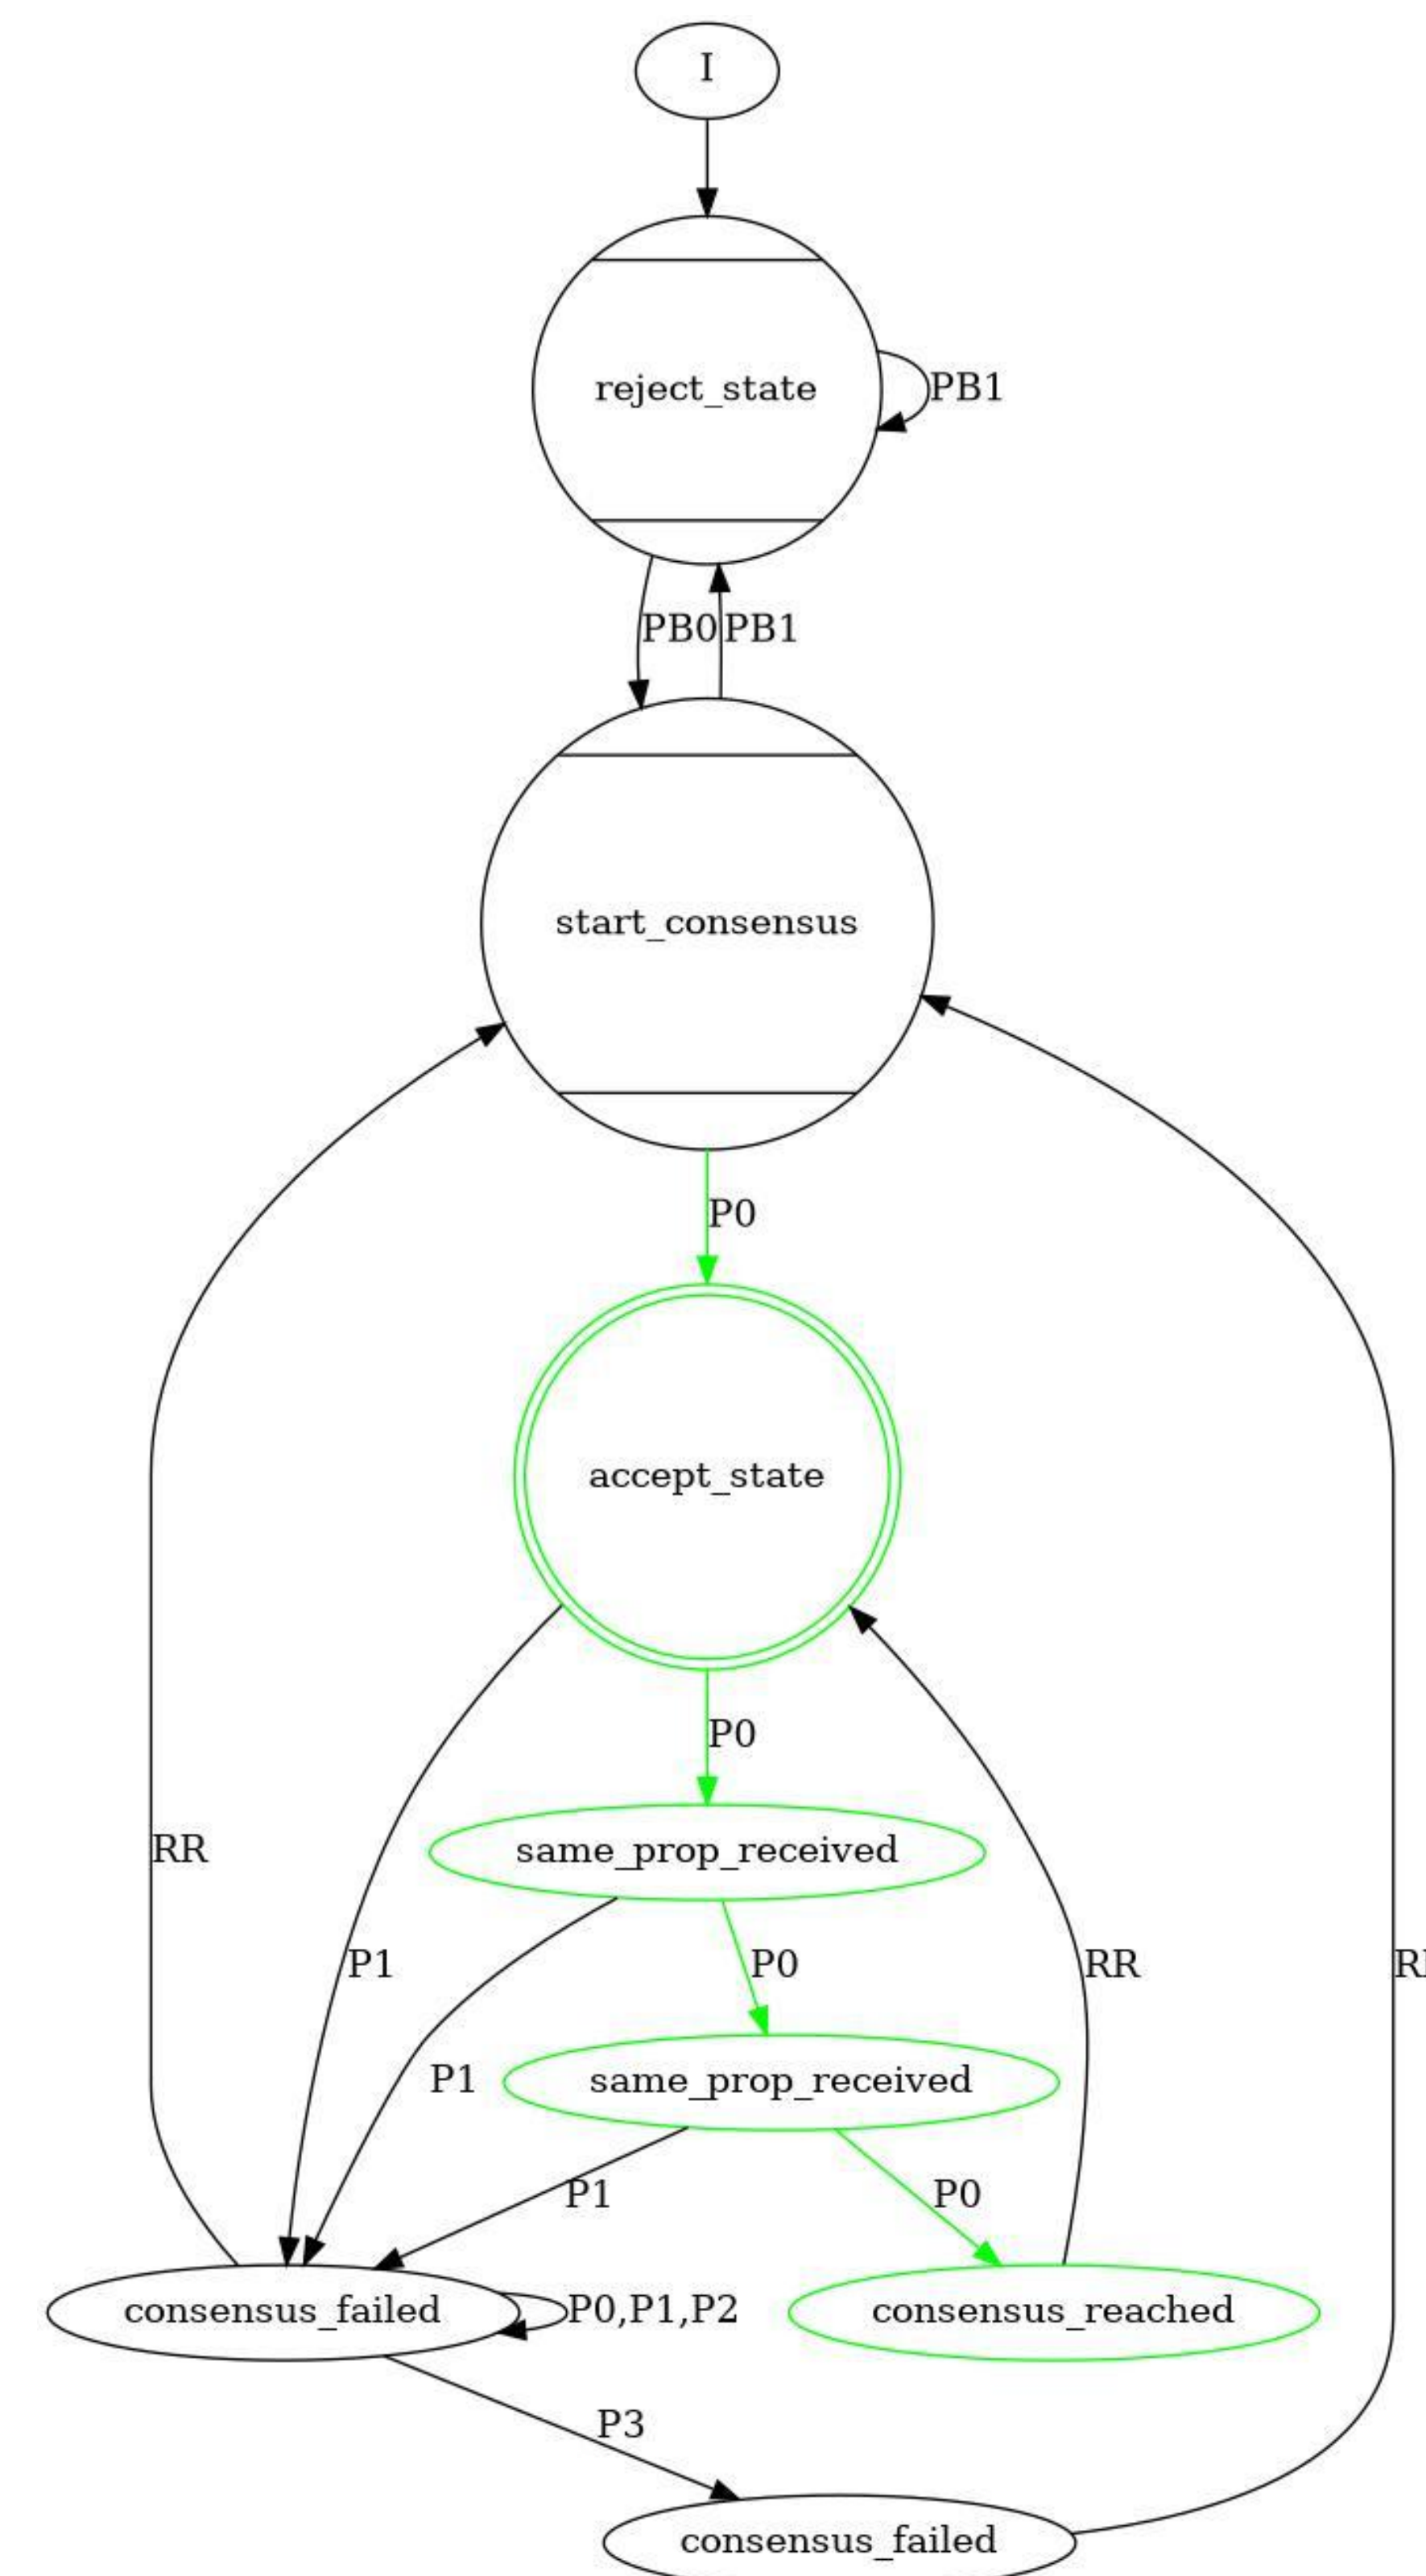

- Test systems using passive model inference tools
- Generate state machine for node in network
- Compare empirical machine to theoretical version

## 3. MODEL INFERENCE

- Generate state machine from traces of program execution
- Passive inference: only learn from traces
- Active inference: learner can query machine while learning

# Improving rippled: Leveraging passive model inference techniques to test large decentralized systems

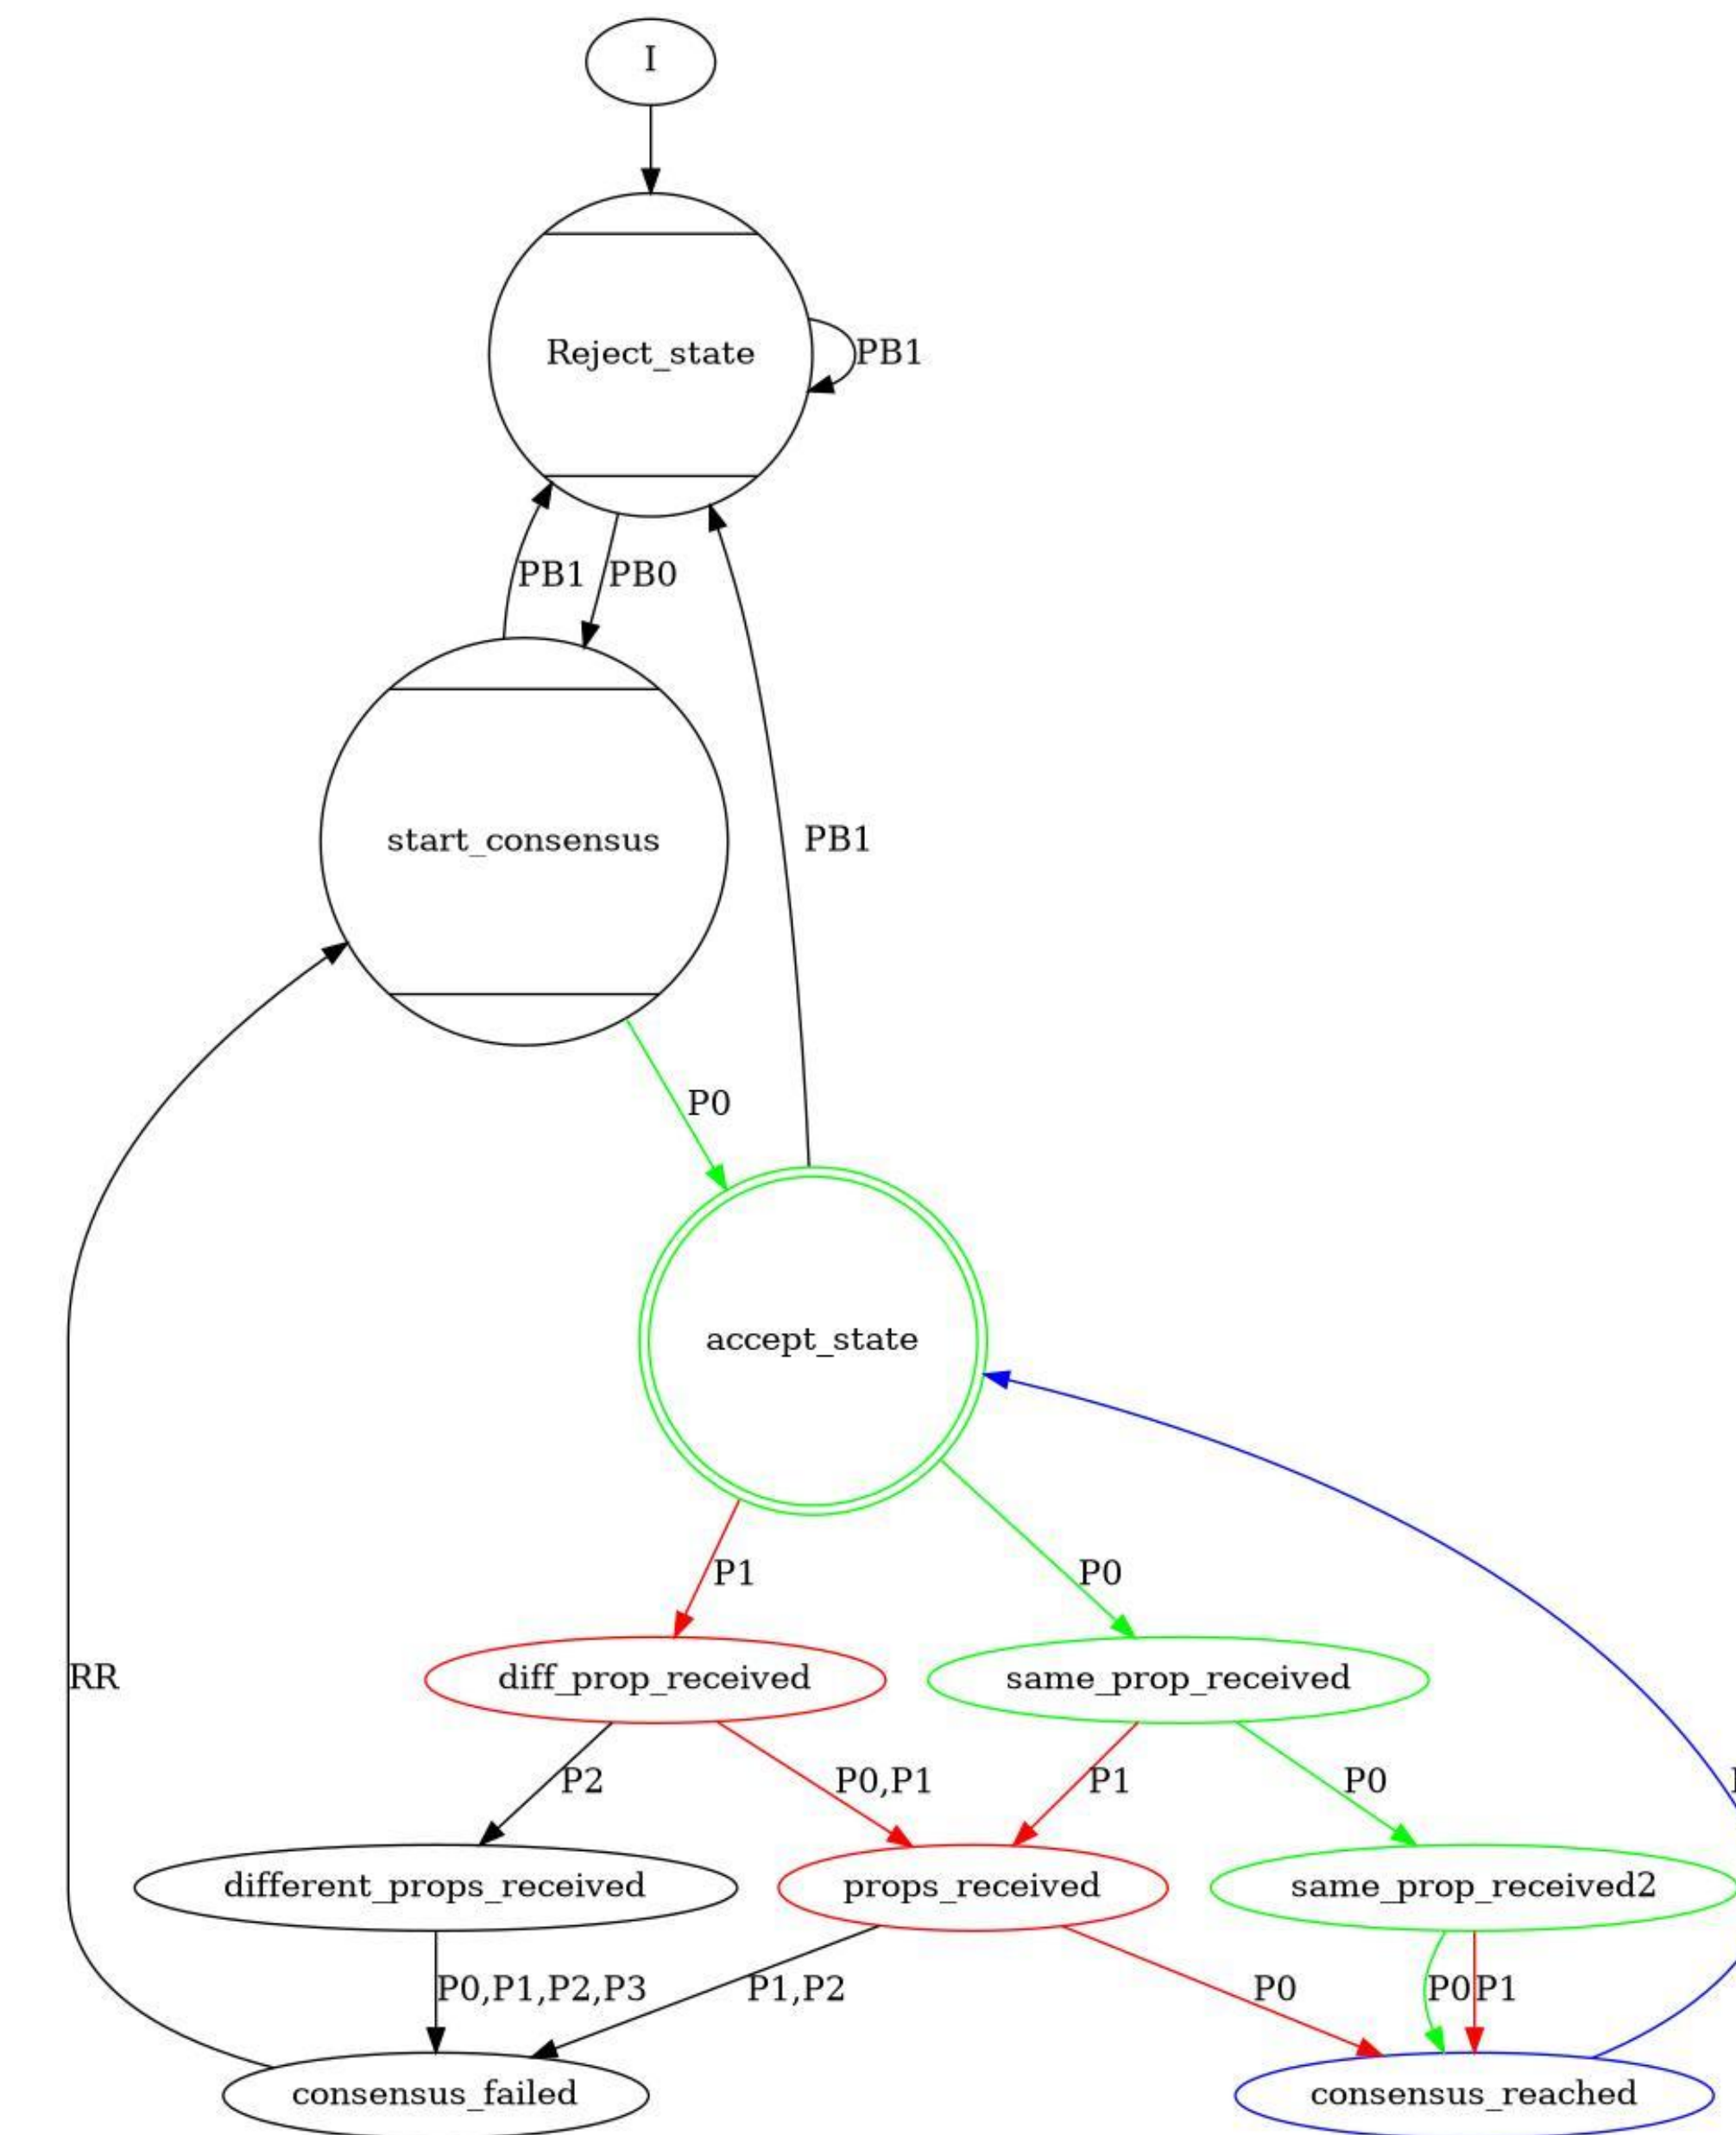

Research Project (CSE3000) By Sengim Karayalcin  
Supervised by Stefanie Roos & Satwik Prabhu Kumble /25-6-2020

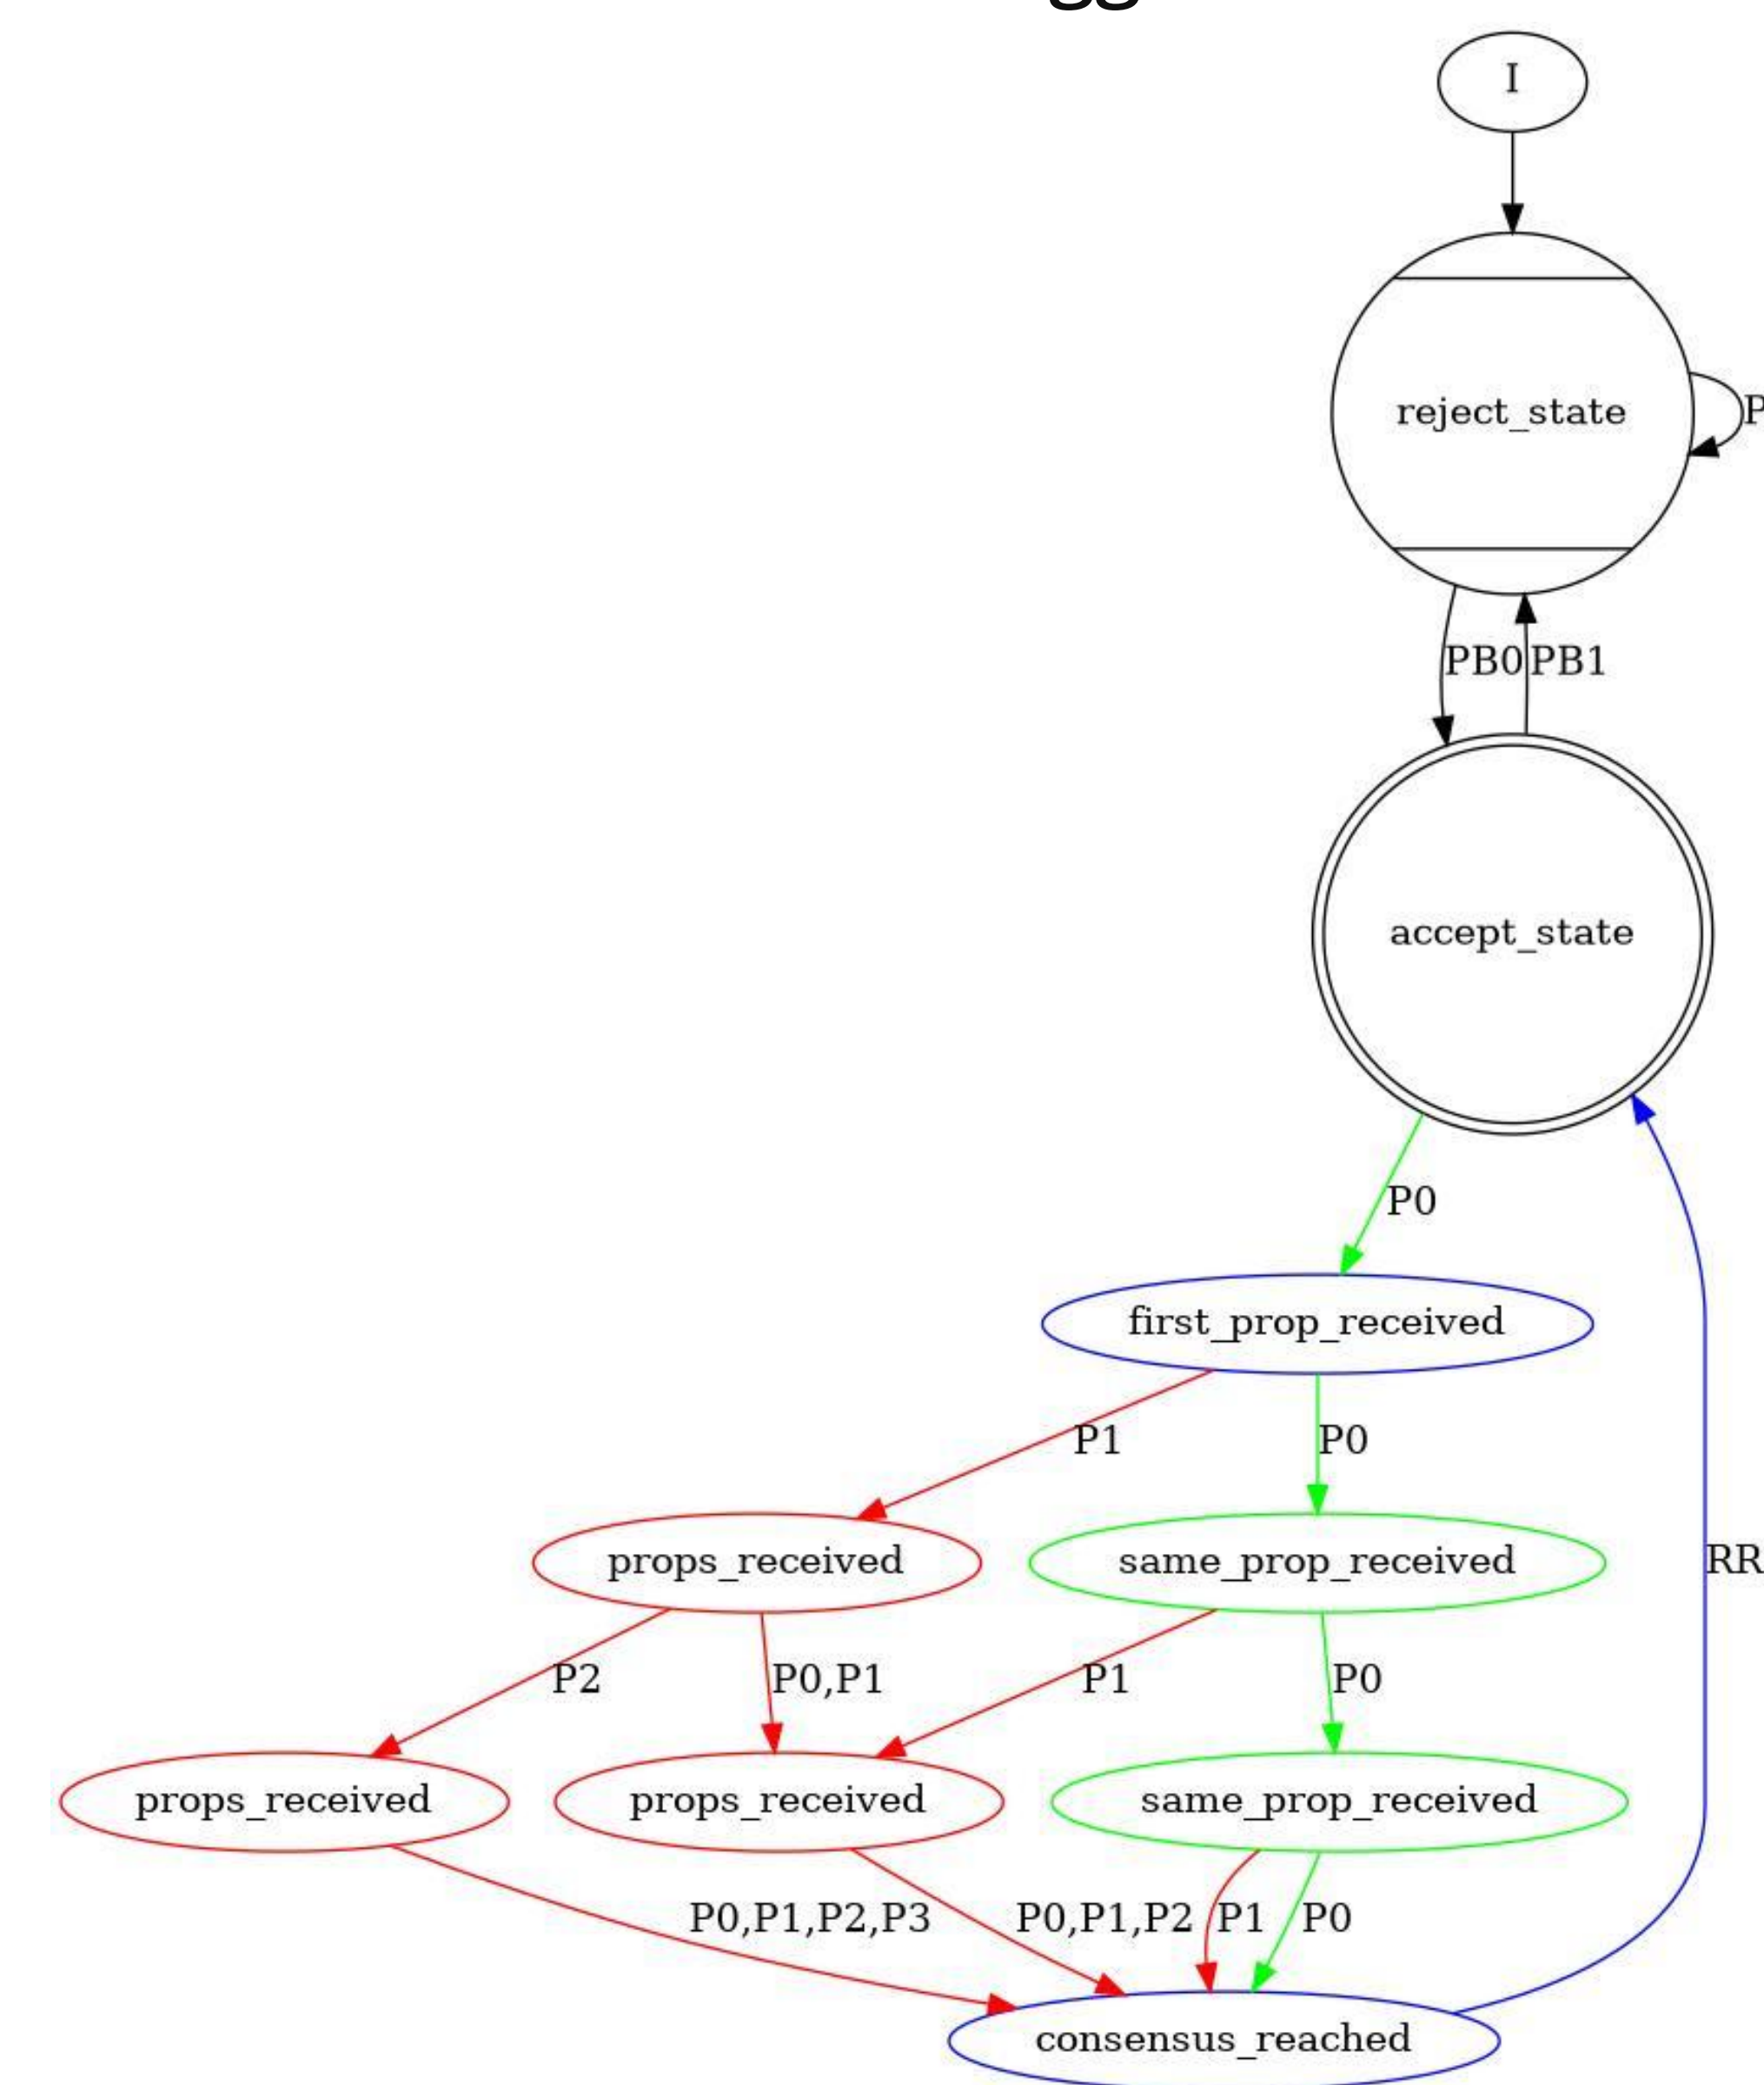

Model of correct node

## RESULTS

- Simulated different bugged and non-bugged nodes
- Bugs visible in model as paths that should not exist

Model of first bugged node

Model of second bugged node

## 4. RIPPLE

- Fast global money transfer system
- Decentralized trust based blockchain
- Home of XRP cryptocurrency

## 5. LIMITATIONS

- Types of bug detectable limited
- Generating model requires knowledge of system
- Practical implementation might be more complex
- Real world bugs harder to spot

## 6. FUTURE WORK

- Try method on live network
- Test active model inference for modeling
- Test method for larger network
