

Analysing the effectiveness of fine-grained dependency analysis to convince developers of updating their dependencies

1 Dependency Maintenance

- **Dependency Maintenance** is critical to assure **security** of large software projects
- **New vulnerabilities** are discovered every day
- Keeping up to date with these vulnerabilities manually is high impossible
- Automated software (e.g. **Dependabot**) do this automatically
- However these bots only analyse at **package-level** which results in lots of false positives

2 Fine-Grained Call Graphs

- The **FASTEN** project has a library to generate **calls graphs** at the **method level**
- Permits us to trace the calls in projects and see if the actual **vulnerable** methods are called
- FASTEN **Metadata Database** contains large collection of projects, vulnerable dependencies with the vulnerable methods.

3 Research Question

- Recent studies have shown fine-grained analysis to be more **accurate**
 - But there hasn't been real research into the benefits for **dependency management**
- “Do people react to fine-grained information more than package-level information (Dependabot)?”

I want to reuse code from previous projects. Is this safe?

Yes you can add this code to your project as dependencies and use a dependency updater like Dependabot to make sure your dependencies have no vulnerabilities

WOW! Dependabot tells me over half my dependencies are vulnerable. Is my code really this insecure?

No most of these alerts are false positives.

How can I get rid of these false positives?

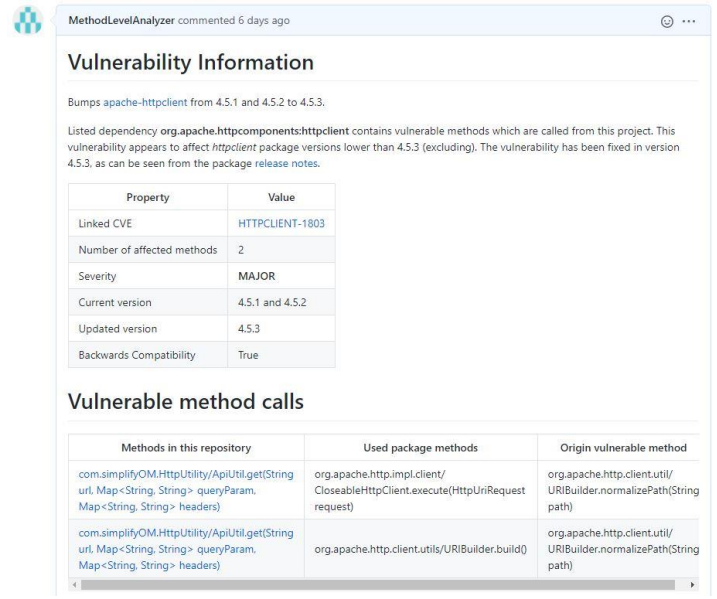

Figure 1: Extra method level information in security pull request

4 Methods of Research

- Identify vulnerable projects using the FASTEN project **library** and **Database**
- Generate **fine grained information** for these projects using call graph generation functionality of the FASTEN project
- Notify these projects with **issues** and **pull requests** containing this **fine grained information** and a survey to understand their experiences with the information
- Record the responses and analyse it to compare to understand whether this information helps.
- Use available **literature** to put into context whether this information really helps to convince developers to update their dependencies.

Table 1 shows the interactions from developers with the pull requests containing the method level information

Table 2 shows the responses to the survey in the pull request

| Activity | Active | Inactive |
|----------------------------|---------|----------|
| # Pull Requests | 25 | 12 |
| # Merges | 3 | 0 |
| # Interactions | 7 | 0 |
| # Ticked Box | 1 | 0 |
| Average Time to Respond | 10 days | NA |
| # Responses within 1 day | 4 | 0 |
| # Responses after 3+ weeks | 3 | 0 |

Table 1: Obtained responses from PRs

5 Conclusions

- Not enough developers responded to the pull requests to be able to draw any hard conclusions
- However data obtained is in line with the literature in terms of developers being unaware of vulnerabilities in their projects.
- The developers that did reply however did suggest that this extra fine-grained information helped with convincing them that the vulnerability did indeed affect their project
- However the extra information doesn't seem to make dealing with the vulnerability easier
- Nevertheless 2 of the developers did indicate they would like to receive more security pull requests with extra fine-grained information
- Further data collecting is therefore required to be able to certify these results and answer the research question.

| Question | Yes | No |
|--|-----|----|
| I was aware of the vulnerability affecting my project before being informed by the Pull Request. | 0 | 3 |
| I was convinced by the provided method call data that the vulnerability indeed affects my project. | 2 | 1 |
| I plan on merging the PR in the near future. | 3 | 0 |
| The provided method call information has made my process of dealing with the vulnerable dependency easier | 1 | 2 |
| I have given priority to the task of fixing the vulnerability over other project tasks that are yet to be completed. | 2 | 1 |
| I would like to receive this kind of method information in future vulnerable dependency Pull Request descriptions. | 2 | 1 |
